We take into account of elasticity effects by choosing

$$\begin{aligned} \underline{\Psi}(\vartheta, \varepsilon(\mathbf{u}), \chi, \nabla\chi) &= c_V \vartheta (1 - \log \vartheta) - \frac{\lambda}{\vartheta_c} (\vartheta - \vartheta_c) \chi \\ &+ \frac{(1 - \chi) \varepsilon(\mathbf{u}) \mathcal{R}_e \varepsilon(\mathbf{u})}{2} + W(\chi) + \frac{\nu}{2} |\nabla\chi|^2 \end{aligned}$$

- ▶  $\varepsilon(\mathbf{u})$  the **linearized symmetric strain tensor**, namely  $\varepsilon_{ij}(\mathbf{u}) := (u_{i,j} + u_{j,i})/2$ ,  $i, j = 1, 2, 3$
- ▶  $(1 - \chi)$  the local proportion of the **non viscous phase**, e.g. the solid phase in solid-liquid phase transitions
- ▶  $\mathcal{R}_e$  a symmetric positive definite **elasticity tensor** (set  $\mathcal{R}_e \equiv \mathbb{I}$ )
- ▶  $c_V$ ,  $\vartheta_c$ ,  $\lambda$  and  $\nu (> 0)$  the specific heat, the equilibrium temperature, the latent heat of the system, and the interfacial energy coefficient (set  $c_V = \lambda/\vartheta_c = 1$ )
- ▶  $W(\chi) + (\nu/2)|\nabla\chi|^2$  a **mixture or interaction free-energy**

# The Pseudo-Potential of dissipation

Following the line of [MOREAU, '71], we include dissipation by means of the following functional

$$\underline{\Phi(\chi_t, \varepsilon(\mathbf{u}_t), \nabla \vartheta)} = \frac{\mu}{2} |\chi_t|^2 + \frac{\chi}{2} \varepsilon(\mathbf{u}_t) \mathcal{R}_v \varepsilon(\mathbf{u}_t) + \frac{h(\vartheta) |\nabla \vartheta|^2}{2\vartheta},$$

where

- ▶  $\mathcal{R}_v$  is a symmetric and positive definite **viscosity matrix** (set  $\mathcal{R}_v \equiv \mathbb{I}$ );
- ▶  $\chi$  represents the local proportion of the **viscous phase**, e.g. the liquid phase in solid-liquid phase transitions;
- ▶  $h(\vartheta) \geq h_0 > 0$  stands for the **heat conductivity** of the process;
- ▶  $\mu > 0$  is a relaxation parameter

# The equation of macroscopic motion

The **equation of macroscopic motion** is the following stress-strain relation, taking into account of accelerations:

$$\mathbf{u}_{tt} - \operatorname{div} \sigma = \mathbf{0} \quad \text{in } \Omega \times (0, T)$$

where  $\sigma$  represents the stress tensor. Using the constitutive law

$$\sigma = \sigma^{nd} + \sigma^d = \frac{\partial \Psi}{\partial \varepsilon(\mathbf{u})} + \frac{\partial \Phi}{\partial \varepsilon(\mathbf{u}_t)},$$

the tensor  $\sigma$  can be written as

$$\sigma = (1 - \chi)\varepsilon(\mathbf{u}) + \chi\varepsilon(\mathbf{u}_t) \quad \text{in } \Omega \times (0, T).$$

We treat here a *pure displacement* boundary value problem for  $\mathbf{u}$

$$\mathbf{u} = \mathbf{0} \quad \text{on } \partial\Omega \times (0, T).$$

## The equation of macroscopic motion

The **equation of macroscopic motion** is the following stress-strain relation, taking into account of accelerations:

$$\mathbf{u}_{tt} - \operatorname{div} \boldsymbol{\sigma} = \mathbf{0} \quad \text{in } \Omega \times (0, T)$$

where  $\boldsymbol{\sigma}$  represents the stress tensor. Using the constitutive law

$$\boldsymbol{\sigma} = \boldsymbol{\sigma}^{nd} + \boldsymbol{\sigma}^d = \frac{\partial \Psi}{\partial \boldsymbol{\varepsilon}(\mathbf{u})} + \frac{\partial \Phi}{\partial \boldsymbol{\varepsilon}(\mathbf{u}_t)},$$

the tensor  $\boldsymbol{\sigma}$  can be written as

$$\boldsymbol{\sigma} = (\mathbf{1} - \chi)\boldsymbol{\varepsilon}(\mathbf{u}) + \chi\boldsymbol{\varepsilon}(\mathbf{u}_t) \quad \text{in } \Omega \times (0, T).$$

We treat here a *pure displacement* boundary value problem for  $\mathbf{u}$

$$\mathbf{u} = \mathbf{0} \quad \text{on } \partial\Omega \times (0, T).$$

However, our analysis carries over to other kinds of boundary conditions on  $\mathbf{u}$  like a *pure traction* problem or a *displacement-traction* problem.

# The equation of microscopic motion

If the volume amount of mechanical energy provided by the external actions is zero, the **generalized principle of virtual power by [FRÉMOND, '02]** gives

$$B - \operatorname{div} \mathbf{H} = 0 \quad \text{in } \Omega \times (0, T), \quad \mathbf{H} \cdot \mathbf{n} = 0 \quad \text{on } \partial\Omega \times (0, T)$$

# The equation of microscopic motion

If the volume amount of mechanical energy provided by the external actions is zero, the **generalized principle of virtual power by [FRÉMOND, '02]** gives

$$B - \operatorname{div} \mathbf{H} = 0 \quad \text{in } \Omega \times (0, T), \quad \mathbf{H} \cdot \mathbf{n} = 0 \quad \text{on } \partial\Omega \times (0, T)$$

where  $B$  and  $\mathbf{H}$  represent the **internal microscopic forces responsible for the mechanically induced heat sources**.

# The equation of microscopic motion

If the volume amount of mechanical energy provided by the external actions is zero, the **generalized principle of virtual power by [FRÉMOND, '02]** gives

$$B - \operatorname{div} \mathbf{H} = 0 \quad \text{in } \Omega \times (0, T), \quad \mathbf{H} \cdot \mathbf{n} = 0 \quad \text{on } \partial\Omega \times (0, T)$$

where  $B$  and  $\mathbf{H}$  represent the **internal microscopic forces responsible for the mechanically induced heat sources**. From the constitutive relations

$$B = \frac{\partial \Psi}{\partial \chi} + \frac{\partial \Phi}{\partial \chi_t} = -\vartheta + \vartheta_c - \frac{|\varepsilon(\mathbf{u})|^2}{2} + W'(\chi) + \mu \chi_t$$

$$\mathbf{H} = \frac{\partial \Psi}{\partial \nabla \chi} = \nu \nabla \chi$$

## The equation of microscopic motion

If the volume amount of mechanical energy provided by the external actions is zero, the **generalized principle of virtual power by [FRÉMOND, '02]** gives

$$B - \operatorname{div} \mathbf{H} = 0 \quad \text{in } \Omega \times (0, T), \quad \mathbf{H} \cdot \mathbf{n} = 0 \quad \text{on } \partial\Omega \times (0, T)$$

where  $B$  and  $\mathbf{H}$  represent the **internal microscopic forces responsible for the mechanically induced heat sources**. From the constitutive relations

$$B = \frac{\partial \Psi}{\partial \chi} + \frac{\partial \Phi}{\partial \chi_t} = -\vartheta + \vartheta_c - \frac{|\varepsilon(\mathbf{u})|^2}{2} + W'(\chi) + \mu \chi_t$$
$$\mathbf{H} = \frac{\partial \Psi}{\partial \nabla \chi} = \nu \nabla \chi$$

we derive **the phase equation**

$$\mu \chi_t - \nu \Delta \chi + W'(\chi) = \vartheta - \vartheta_c + \frac{|\varepsilon(\mathbf{u})|^2}{2} \quad \text{in } \Omega \times (0, T)$$

coupled with the B.C.  $\partial_n \chi = 0$  on  $\partial\Omega \times (0, T)$ .

# The internal energy balance

The first principle of thermodynamics can be expressed as

$$e_t + \operatorname{div} \mathbf{q} = \sigma : \varepsilon(\mathbf{u}_t) + B\chi_t + \mathbf{H} \cdot \nabla \chi_t$$

Existence of weak solutions

# The thermodynamical consistency

Our model complies with the Second Principle of Thermodynamics: in fact, the following form of the **Clausius-Duhem inequality**

$$s_t + \operatorname{div} \left( \frac{\mathbf{q}}{\vartheta} \right) \geq 0$$

holds true.

- ▶ It is sufficient to note that the internal energy balance can be expressed in terms of **the entropy**  $s = -\frac{\partial \Psi}{\partial \vartheta}$  in this way:

$$\vartheta \left( s_t + \operatorname{div} \left( \frac{\mathbf{q}}{\vartheta} \right) \right) = \sigma^d : \varepsilon(\mathbf{u}_t) + B^d \chi_t - \frac{\mathbf{q}}{\vartheta} \cdot \nabla \vartheta$$

$B^d$  being the dissipative part of  $B$

- ▶ The right-hand side turns out to be non negative because  $(\sigma^d, B^d, -\mathbf{q}/\vartheta) \in \partial \Phi(\mathbf{u}_t, \chi_t, \nabla \vartheta)$ , and  $\Phi$  is convex in all of its variables

# The resulting PDE system

The PDE system in  $\Omega \times (0, T)$  turns out to be:

$$\vartheta_t + \chi_t \vartheta - \operatorname{div}(h(\vartheta) \nabla \vartheta) = \mu |\chi_t|^2 + \chi |\varepsilon(\mathbf{u}_t)|^2$$

$$\mu \chi_t - \nu \Delta \chi + W'(\chi) = \vartheta - \vartheta_c + \frac{|\varepsilon(\mathbf{u})|^2}{2}$$

$$\mathbf{u}_{tt} - \operatorname{div}((1 - \chi)\varepsilon(\mathbf{u}) + \chi\varepsilon(\mathbf{u}_t)) = \mathbf{0}$$

coupled with the following initial and boundary conditions:

$$\vartheta(0) = \vartheta_0, \quad \chi(0) = \chi_0, \quad \mathbf{u}(0) = \mathbf{u}_0, \quad \mathbf{u}_t(0) = \mathbf{v}_0 \quad \text{in } \Omega$$

$$\partial_n \vartheta = 0, \quad \partial_n \chi = 0, \quad \mathbf{u} = \mathbf{0} \quad \text{on } \partial\Omega \times (0, T)$$

# Formulation of Problem 1 (The case $h \equiv 1$ – Fourier heat flux)

Find functions  $\vartheta, \chi : \Omega \times [0, T] \rightarrow \mathbb{R}$  such that

$$\chi(x, t) \in \text{dom}(W) \text{ and } \vartheta(x, t) > 0 \text{ a.e. in } \Omega \times (0, T)$$

and  $\mathbf{u} : \Omega \times [0, T] \rightarrow \mathbb{R}^3$  fulfilling the initial conditions:

$$\vartheta(0) = \vartheta_0, \quad \chi(0) = \chi_0, \quad \mathbf{u}(0) = \mathbf{u}_0, \quad \mathbf{u}_t(0) = \mathbf{v}_0 \quad \text{in } \Omega, \quad (\text{IC1})$$

the equations a.e. in  $\Omega \times (0, T)$ :

$$\vartheta_t + \chi_t \vartheta - \Delta \vartheta = \mu |\chi_t|^2 + \chi |\varepsilon(\mathbf{u}_t)|^2 \quad (\text{P1a})$$

$$\mu \chi_t - \nu \Delta \chi + W'(\chi) = \vartheta - \vartheta_c + \frac{|\varepsilon(\mathbf{u})|^2}{2} \quad (\text{P1b})$$

$$\mathbf{u}_{tt} - \text{div}((1 - \chi)\varepsilon(\mathbf{u}) + \chi\varepsilon(\mathbf{u}_t)) = \mathbf{0} \quad (\text{P1c})$$

and the boundary conditions:

$$\partial_n \vartheta = 0, \quad \partial_n \chi = 0, \quad \mathbf{u} = \mathbf{0} \quad \text{on } \partial\Omega \times (0, T). \quad (\text{BC1})$$

## Formulation of Problem 2 (The case $\varepsilon(\mathbf{u}) = \text{const}$ )

Find functions  $\vartheta, \chi : \Omega \times [0, T] \rightarrow \mathbb{R}$  such that

$$\chi(x, t) \in \text{dom}(W) \text{ and } \vartheta(x, t) > 0 \text{ a.e. in } \Omega \times (0, T)$$

and fulfilling the equations a.e. in  $\Omega \times (0, T)$ :

$$\vartheta_t + \vartheta \chi_t - \text{div}(h(\vartheta) \nabla \vartheta) = \mu |\chi_t|^2 \quad (\text{P2a})$$

$$\mu \chi_t - \nu \Delta \chi + W'(\chi) = \vartheta - \vartheta_c \quad (\text{P2b})$$

and the initial and boundary conditions:

$$\vartheta(0) = \vartheta_0, \quad \chi(0) = \chi_0 \quad \text{in } \Omega \quad (\text{IC2})$$

$$\partial_n \vartheta = 0, \quad \partial_n \chi = 0 \quad \text{on } \partial \Omega \times (0, T). \quad (\text{BC2})$$

## Relations between Problem 2 and the “classical” models

- ▶ The Sfehan problem. If  $\mu = \nu = 0$ ,  $h \equiv 1$  and  $W' = \partial I_{[0,1]} + \vartheta_c$  the system (P2a–P2b) reduces to

Main analytical results for Problem 2

Assumptions  
Existence of strong solutions  
Existence of weak solutions

# The global results

Joint work with R. Rossi. For **Problem 1 in 1D**:

- ▶ well-posedness for the full system (P1a–BC1) on  $[0, T]$ ;
- ▶ analysis of the associated  $\omega$ -limit of trajectory for the system coupling (IC1), (P1b–BC1) with the simplified internal energy equation:

$$\vartheta_t + \vartheta \chi_t - \Delta \vartheta = 0. \quad (\text{P1a}')$$

Joint work with E. Feireisl, H. Petzeltová. For **Problem 2 in 3D**:

- ▶ existence of regular solutions and uniqueness in case  $h(\vartheta) = h_0 + \varepsilon k(\vartheta)$  and  $k(\vartheta) \geq c_k \vartheta^p$  with  $\varepsilon > 0$ ,  $p \in [3, +\infty)$ ;

Existence of weak solutions

Theorem 1 (Well-posedness for Problem 1 on  $[0, T]$ )

Fix  $T > 0$  and assume Hypothesis 1. Then

- ◇ there exist  $\delta \in (0, 1)$  - depending on the potential  $W$  and on the initial datum  $\chi_0$ ,
- ◇ there exist  $\zeta_T \in (0, 1)$  - depending on the potential  $W$ , on the initial datum  $\chi_0$ , and on the final time  $T$ ,
- ◇ there exist  $\theta_T^* > 0$  - depending on  $T$  and on the problem data,
- ◇ and there exist a unique triple  $(\vartheta, \chi, \mathbf{u})$  solving **Problem 1** and complying with

$$\vartheta \in L^2(0, T; H_N^2(\Omega)) \cap L^\infty(0, T; H^1(0, \ell)) \cap H^1(0, T; L^2(\Omega)) \\ \cap W^{1,\infty}(0, T; H^1(0, \ell)')$$

$$\chi \in L^\infty(0, T; H_N^2(\Omega)) \cap H^1(0, T; H^1(0, \ell)) \cap W^{1,\infty}(0, T; L^2(\Omega))$$

$$\mathbf{u} \in H^1(0, T; H_0^2(0, \ell)) \cap W^{1,\infty}(0, T; H_0^1(0, \ell)) \cap H^2(0, T; L^2(\Omega))$$

and such that the following separation inequalities hold true:

$$\vartheta(x, t) \geq \theta_T^*, \quad \delta \leq \chi(x, t) \leq \zeta_T \quad \forall (x, t) \in [0, \ell] \times [0, T].$$

## Theorem 2 (Long-time behavior of solution to Problem 1)

We consider **Problem 1**, where (P1a) is replaced (within the framework of *small perturbation assumptions*) with

$$\vartheta_t + \vartheta \chi_t - \Delta \vartheta = 0 \quad \text{a.e. in } (0, \ell) \times (0, T). \quad (\text{P1a}')$$

Then, the nonempty  $\omega$ -limit set:

$$\begin{aligned} \omega(\vartheta_0, \chi_0, \mathbf{u}_0) := & \{(\vartheta_\infty, \chi_\infty, \mathbf{u}_\infty) \in H^1(0, \ell) \times H^1(0, \ell) \times H_0^1(0, \ell) : \\ & \exists t_n \nearrow \infty : (\vartheta(t_n), \chi(t_n), \mathbf{u}(t_n)) \rightarrow (\vartheta_\infty, \chi_\infty, \mathbf{u}_\infty) \\ & \text{in } H^{1-\nu}(0, \ell) \times H^{1-\nu}(0, \ell) \times H_0^{1-\nu}(0, \ell) \forall \nu \in (0, 1)\} \end{aligned}$$

is compact and connected in  $H^{1-\nu}(0, \ell) \times H^{1-\nu}(0, \ell) \times H_0^{1-\nu}(0, \ell)$  for all  $\nu \in (0, 1)$ .

## Theorem 2 (Long-time behavior of solution to Problem 1)

We consider **Problem 1**, where (P1a) is replaced (within the framework of *small perturbation assumptions*) with

$$\vartheta_t + \vartheta \chi_t - \Delta \vartheta = 0 \quad \text{a.e. in } (0, \ell) \times (0, T). \quad (\text{P1a}')$$

Then, the nonempty  $\omega$ -limit set:

$$\begin{aligned} \omega(\vartheta_0, \chi_0, \mathbf{u}_0) := & \{(\vartheta_\infty, \chi_\infty, \mathbf{u}_\infty) \in H^1(0, \ell) \times H^1(0, \ell) \times H_0^1(0, \ell) : \\ & \exists t_n \nearrow \infty : (\vartheta(t_n), \chi(t_n), \mathbf{u}(t_n)) \rightarrow (\vartheta_\infty, \chi_\infty, \mathbf{u}_\infty) \\ & \text{in } H^{1-\nu}(0, \ell) \times H^{1-\nu}(0, \ell) \times H_0^{1-\nu}(0, \ell) \forall \nu \in (0, 1)\} \end{aligned}$$

is compact and connected in  $H^{1-\nu}(0, \ell) \times H^{1-\nu}(0, \ell) \times H_0^{1-\nu}(0, \ell)$  for all  $\nu \in (0, 1)$ . Moreover,  $\exists \zeta_\infty \in (0, 1) : \text{all } (\vartheta_\infty, \chi_\infty, \mathbf{u}_\infty) \in \omega(\vartheta_0, \chi_0, \mathbf{u}_0)$  solves the stationary problem in  $(0, \ell)$ :

$$-\Delta \vartheta_\infty = 0, \quad -\Delta \chi_\infty + \beta(\chi_\infty) + \gamma(\chi_\infty) = \vartheta_\infty, \quad \mathbf{u}_\infty = 0$$

and fulfils

$$\vartheta_\infty(x) \geq 0, \quad \min_{x \in [0, \ell]} \chi_\infty(x) \geq \delta, \quad \max_{x \in [0, \ell]} \chi_\infty(x) \leq \zeta_\infty.$$

In particular,  $\exists \bar{\vartheta}_\infty \in [0, +\infty) : \vartheta_\infty(x) = \bar{\vartheta}_\infty$  for all  $x \in [0, \ell]$ .

## Recall: Problem 2 (The case $\varepsilon(\mathbf{u}) = \text{const}$ )

Find functions  $\vartheta, \chi : \Omega \times [0, T] \rightarrow \mathbb{R}$  such that

$$\chi(x, t) \in \text{dom}(W) \text{ and } \vartheta(x, t) > 0 \text{ a.e. in } \Omega \times (0, T)$$

fulfilling the equations a.e. in  $\Omega \times (0, T)$ :

$$\vartheta_t + \vartheta \chi_t - \text{div}(h(\vartheta) \nabla \vartheta) = \mu |\chi_t|^2 \quad (\text{P2a})$$

$$\mu \chi_t - \nu \Delta \chi + W'(\chi) = \vartheta - \vartheta_c \quad (\text{P2b})$$

and the initial and boundary conditions:

$$\vartheta(0) = \vartheta_0, \quad \chi(0) = \chi_0 \quad \text{in } \Omega \quad (\text{BC2})$$

$$\partial_n \vartheta = 0, \quad \partial_n \chi = 0 \quad \text{on } \partial \Omega \times (0, T). \quad (\text{IC2})$$

Assumptions  
Well-posedness in finite times  
Long-time behavior of solution

Main analytical results for Problem 2

**Assumptions**

Existence of strong solutions  
Existence of weak solutions

## Hypothesis 2 (To solve Problem 2)

We fix two positive constants  $c_k, c_w$ , an three exponents  $p \in [3, +\infty)$ ,  $q \in (5, +\infty)$ ,  $\alpha \in (0, 1)$ , and assume that

(i)  $\mathbf{q} := -\nabla\vartheta - \varepsilon k(\vartheta)\nabla\vartheta$ , with  $\varepsilon \geq 0$  and  $k : [0, +\infty) \rightarrow [0, +\infty)$ ,  $k \in C^1([0, +\infty))$ , such that  $k(r) \geq c_k r^p$

(ii)  $W = \widehat{\beta} + \widehat{\gamma}$  where

$\widehat{\beta} : \text{dom}(\widehat{\beta}) \rightarrow \mathbb{R}$  is proper, lower semi-continuous, convex,

$\widehat{\gamma} \in C^{1,1}(\text{dom}(\widehat{\beta}))$  and  $W(r) \geq c_w r^2$  for all  $r \in \text{dom}(\widehat{\beta})$

### Theorem 3 (Well-posedness for Problem 2 in case $\varepsilon > 0$ ).

Fix  $T > 0$  and assume Hypothesis 2. Suppose that  $W$ , satisfies

- ▶ either the regularity assumption

$$W \in C^2(\mathbb{R}), \quad |W''(r)| \leq c_{Lip} \quad \forall r \in \mathbb{R},$$

for some positive constant  $c_{Lip}$

- ▶ or  $\overline{\text{dom}(\widehat{\beta})} = [0, 1]$ ,  $\beta$  is differentiable on  $(0, 1)$  and for all  $\rho > 0$ ,  $\beta$  is a Lipschitz continuous function on  $[\rho, 1 - \rho]$ . It satisfy the following "coercivity" conditions

$$\lim_{x \rightarrow 0^+} \beta(x) = -\infty, \quad \lim_{x \rightarrow 1^-} \beta(x) = +\infty;$$

### Theorem 3 (Well-posedness for Problem 2 in case $\varepsilon > 0$ ).

Fix  $T > 0$  and assume Hypothesis 2. Suppose that  $W$ , satisfies

- ▶ either the regularity assumption

$$W \in C^2(\mathbb{R}), \quad |W''(r)| \leq c_{Lip} \quad \forall r \in \mathbb{R},$$

for some positive constant  $c_{Lip}$

- ▶ or  $\overline{\text{dom}(\widehat{\beta})} = [0, 1]$ ,  $\beta$  is differentiable on  $(0, 1)$  and for all  $\rho > 0$ ,  $\beta$  is a Lipschitz continuous function on  $[\rho, 1 - \rho]$ . It satisfy the following "coercivity" conditions

$$\lim_{x \rightarrow 0^+} \beta(x) = -\infty, \quad \lim_{x \rightarrow 1^-} \beta(x) = +\infty;$$

the datum  $\chi_0$  is separated from 0 and 1:

$$\min_{x \in \overline{\Omega}} \chi_0(x) > 0, \quad \max_{x \in \overline{\Omega}} \chi_0(x) < 1.$$

Existence of weak solutions

### Theorem 3 (Well-posedness for Problem 2 in case $\varepsilon > 0$ ).

Fix  $T > 0$  and assume Hypothesis 2. Suppose that  $W$ , satisfies

- ▶ either the regularity assumption

$$W \in C^2(\mathbb{R}), \quad |W''(r)| \leq c_{Lip} \quad \forall r \in \mathbb{R},$$

for some positive constant  $c_{Lip}$

- ▶ or  $\overline{\text{dom}(\widehat{\beta})} = [0, 1]$ ,  $\beta$  is differentiable on  $(0, 1)$  and for all  $\rho > 0$ ,  $\beta$  is a Lipschitz continuous function on  $[\rho, 1 - \rho]$ . It satisfy the following "coercivity" conditions

$$\lim_{x \rightarrow 0^+} \beta(x) = -\infty, \quad \lim_{x \rightarrow 1^-} \beta(x) = +\infty;$$

the datum  $\chi_0$  is separated from 0 and 1:

$$\min_{x \in \overline{\Omega}} \chi_0(x) > 0, \quad \max_{x \in \overline{\Omega}} \chi_0(x) < 1.$$

Then, there exist a unique solution  $(\vartheta, \chi)$  to Problem 2 such that it complies with the following regularity properties:

$$\vartheta \in C^{0,\sigma}(\overline{Q_T}) \cap C^0((0, T]; H^2(\Omega)) \cap C^1((0, T]; C^{0,\sigma}(\overline{\Omega}))$$

$$\chi \in C^{0,\sigma}(\overline{Q_T}) \cap C^0((0, T]; H^2(\Omega)) \cap C^1((0, T]; C^{0,\sigma}(\overline{\Omega})).$$

## Theorem 4 (Existence for Problem 2 in case $\varepsilon = 0$ )

Fix  $T > 0$  and assume Hypothesis 2. Let  $s \in (13/8, 11/6)$  in the 3D case,  $s \in (5/3, 2)$  in the 2D case.

Existence of strong solutions

**Existence of weak solutions**

**Theorem 4 (Existence for Problem 2 in case  $\varepsilon = 0$ )**

Fix  $T > 0$  and assume Hypothesis 2. Let  $s \in (13/8, 11/6)$  in the 3D case,  $s \in (5/3, 2)$  in the 2D case. Then there exists at least one pair  $(\vartheta, \chi)$  with the regularities

$$\vartheta \in L^\infty(0, T; L^1(\Omega)) \cap L^s(Q_T)$$

$$\vartheta(x, t) > 0 \quad \text{a. e. in } Q_T$$

$$\log(\vartheta) \in L^\infty(0, T; L^1(\Omega)) \cap L^2(0, T; H^1(\Omega))$$

$$\chi \in C^0([0, T]; H^1(\Omega)) \cap L^s(0, T; W^{2,s}(\Omega)), \quad \chi_t \in L^s(Q_T)$$

satisfying the *entropy inequality* ( $\forall \varphi \in \mathcal{D}(\overline{Q}_T)$ ,  $\varphi \geq 0$ ):

$$\begin{aligned} \int_0^T \int_\Omega ((\log \vartheta + \chi) \partial_t \varphi + \nabla \log \vartheta \cdot \nabla \varphi) \, dx \, dt \\ \leq \int_0^T \int_\Omega \frac{1}{\vartheta} \left( -\mu |\chi_t|^2 + \nabla \log \vartheta \cdot \nabla \vartheta \right) \varphi \, dx \, dt, \end{aligned}$$

equation (P2b), initial and boundary conditions (BC2–IC2), and the *total energy conservation*

$$E(t) = E(0) \quad \text{a.e. in } [0, T], \quad \text{where } E \equiv \int_\Omega \left( \vartheta + W(\chi) + \frac{\nu}{2} |\nabla \chi|^2 \right) \, dx.$$
